TROPONIN I QUANTITATIVE

DESCRIPTION	RESULT	UNITS	REF.VALUE	REMARKS
TROPONIN I QUANTITATIVE	0.03	ng/mL	< 0.06	Normal

Comments

Any increase in Troponin I >0.06 ng/mL (> 99th percentile URL & 10% CV) indicates myocardial necrosis and therefore, risk of arrhythmia or ongoing infarction.

However, Troponin I <0.06 ng/mL does not exclude a clinical diagnosis of acute coronary syndrome, early myocardial infarction (or other aetiologies of myocardial damage).

Suggest repeat quantitative Troponin I after 3 – 6 hours interval to check rising titer in order to confirm or exclude an ongoing myocardial necrosis, if there is clinical indication.

(References: Third Universal Definition of Myocardial Infarction, Circulation. 2012; 126:2020-2035) This quantitative Troponin I assay performed by Immunofluorescence technology on Tosoh AIA fully automated Immunochemistry analyzer.
